

Project Report

Crypto Analysis Dashboard Project Report

Objective

The objective of this project was to analyze cryptocurrency market data using Microsoft Excel and build interactive dashboards that provide meaningful insights for investors. The project demonstrates Excel dashboard development, Pivot Tables, Pivot Charts, KPI creation, slicers, lookup functions, and VBA automation.

Task 1 – Time-Based Visibility Dashboard

A dashboard was created to display the top cryptocurrencies based on 24-hour trading volume. VBA was used to control chart visibility based on specific conditions, allowing dynamic interaction with the dashboard.

Task 2 – Crypto Coin Comparison

A comparison dashboard was developed to compare two selected cryptocurrencies. The dashboard dynamically retrieves and displays each coin's symbol, price, market capitalization, trading volume, and circulating supply using XLOOKUP formulas.

Task 3 – Liquidity Analysis

An interactive dashboard was built to identify the top five cryptocurrencies with the highest trading volume. Pivot Tables, Pivot Charts, and slicers were used to filter data based on price ranges and visualize liquidity distribution.

Task 4 – Price Change Analysis

This dashboard analyzes the top ten cryptocurrencies based on price change. Users can filter coins by price range using slicers, while KPIs display selected coin details such as name, symbol, and price change.

Task 5 – Historical Price Change Insights

Historical cryptocurrency performance was analyzed by comparing 7-day and 24-hour price changes. The dashboard ranks the top ten coins based on 1-hour price change and allows filtering using a custom price range slicer.

Task 6 – Low Budget Investment Insights

A KPI dashboard was designed to help identify cryptocurrencies with the lowest average downfall percentage within different price ranges. The dashboard dynamically displays the coin name, symbol, price, average downfall, and total number of coins in the selected range.

Skills Demonstrated

- Microsoft Excel
- Pivot Tables
- Pivot Charts
- Slicers
- XLOOKUP
- VBA Macros
- Dashboard Design
- KPI Development
- Data Cleaning
- Data Analysis

Conclusion

This project successfully demonstrates the use of Microsoft Excel as a powerful business intelligence and data visualization tool. Interactive dashboards, automation, and dynamic reporting provide valuable insights into cryptocurrency market trends while showcasing practical Excel data analysis skills.
